MAMMOGRAM WITH 3D TOMOGRAPHY AND BREAST ULTRASOUND

CLINICAL INDICATION

Routine.

FINDINGS

This is a baseline mammogram.
Imaging of the left breast is suboptimal, due to associated electronic device here.
The breasts show a BI-RADS C type background density.
No concerning microcalcifications are evident.
No discrete suspicious space occupying focus can be seen.
The skin and nipples are within normal limits.
The axillae maintain a normal configuration.
Ultrasound of the axillae remains within normal limits.
There are some benign appearing axillary lymph nodes.
There is a transversely orientated hypoechoic focus noted within the left breast. This measures 0.8cm in diameter. I think this is most likely in keeping with a fibroadenoma.

COMMENT

No concerning focus can be seen on the mammogram.
There is a probable fibroadenoma noted within the left breast.
I think that a short term sonar follow up can be performed in about 6 months to help confirm stability of this focus.

PELVIC SONAR

The right kidney measures 10.8cm in diameter. The left kidney 9.9cm. Both kidneys are of normal echogenicity.
There is no hydronephrosis.
The urinary bladder remains within normal limits.
The uterus contains an IUD. There is a simple appearing cyst associated with the left ovary measuring 2.0 x 1.2 cm in size.
The left ovary shows a volume of 6.7ml. The right ovary 3.9ml.

COMMENT

There is a simple appearing follicular cyst associated with the left ovary.
Further imaging as clinically indicated.
